Abstract: This program displays an NHL player's seasonal stats.

Introduction: I got the idea for this program from a YouTube channel's Discord server. The manager of the Discord server added a feature that allowed the user to access an NHL player's seasonal stats just by typing the name of the player in one of the chat rooms. I wanted to emulate that program or come very close to it.

Detailed System Description: This program asks the user to enter an NHL player's name. The program then interacts with the Official NHL Stats website and collects the specific information (i.e. goals, assists, points etc.). This information is then displayed to the user with the name of the player.

Requirements: The access of the website and the display of the player's stats

Literature Survey:

User Manual: The user enters the name of an NHL player (i.e. Wayne Gretzky)

Conclusion: This program displays an NHL player's seasonal stats by interacting with the Official NHL Stats website.

References/Bibliography:

What I still need to accomplish: The actual display of the player's name and the stats associated with that player.
